

# Neural Networks

## 1. Introduction Spring 2021

# Logistics: By now you must have...

- Already watched lecture 0 (logistics)
  - If not do so at once
- Been to the course website
  - <http://deeplearning.cs.cmu.edu>
  - If you have not done so, please visit it at once
- Course objectives, logistics, quiz and homework policies, and grading policies, all have been explained in both, the logistics lecture and on the course page
- Please familiarize yourself with this information at once

# Logistics: Part 2

- You should already have
  - Signed on to piazza
  - Verified you have access to canvas and autolab
  - Ensured you have AWS accounts setup
    - And tested out Google colab
- You have received a note on forming study groups
  - We recommend this; you learn better in teams than you do by yourself

**– Please sign up for the study groups *immediately!!!!!!!!!!!!***

# Course philosophy

- No student left behind
- Please use the available resources
  - TAs
  - Study groups and TA mentors
  - Dozens of office hours weekly
  - Me (email me, or just walk into my office if I'm free)
  - Your classmates and friends
- If under stress/unable to perform, please reach out
  - To your TA mentor
  - To me
  - We will do our best to help you
- In our ideal world *every* student will *earn* an A

# Attendance

- Sections **A/B/M**: We will use in-class polls to verify attendance
  - Multiple polls posted at random times through the class
  - Polls will be posted on piazza
    - Please keep your piazza (and *only* your piazza) open
  - You must respond to all polls
    - We don't score you on correctness, only on whether you responded
- Kigali/SV and students who have permission to view videos instead: Please watch mediatech videos
  - We will gather your attendance from there

# A minute for questions...

Caveat: Slide deck often have many "hidden" slides that will not be shown during the lecture, but will feature in your weekly quizzes

# Neural Networks are taking over!

- Neural networks have become one of *the* main approaches to AI
- They have been successfully applied to various pattern recognition, prediction, and analysis problems
- In many problems they have established the state of the art
  - Often exceeding previous benchmarks by large margins
  - Sometimes solving problems you couldn't solve using earlier ML methods

# Breakthroughs with neural networks

## Microsoft AI Beats Humans at Speech Recognition

By Richard Adhikari  
Oct 20, 2016 11:40 AM PT

Print Email

Image: Adobe Stock

Microsoft's Artificial Intelligence and Research Unit earlier this week reported that its speech recognition technology had surpassed the performance of human transcriptionists.

### How do you feel about Black Friday and Cyber Monday?

- ☐ They're great -- I get a lot of bargains!
- ☐ The deals are too spread out -- I'd prefer just one day.
- ☐ They're a fun way to kick off the holiday season.
- ☐ I don't like the commercialization of Thanksgiving Day.
- ☐ They're crucial for the retail industry and the economy.
- ☐ The deals typically aren't that good.

# Successes with neural networks

- And a variety of other problems:
  - From art to astronomy to healthcare..
  - and even predicting stock markets!

# So what are neural networks??

- What are these boxes?

# So what are neural networks??

- It begins with this..

# So what are neural networks??

"The Thinker!"  
by Augustin Rodin

- Or even earlier.. with this..

# The magical capacity of humans

- Humans can
  - Learn
  - Solve problems
  - Recognize patterns
  - Create
  - Cogitate
  - ...
- Worthy of emulation
- But how do humans “work”?

Dante!

# Cognition and the brain..

- “If the brain was simple enough to be understood - we would be too simple to understand it!”
  - Marvin Minsky

# Early Models of Human Cognition

- **Associationism**
  - Humans learn through association
- **400BC-1900AD:** Plato, David Hume, Ivan Pavlov..

# What are “Associations”

- Lightning is generally followed by thunder
  - Ergo – “hey here’s a bolt of lightning, we’re going to hear thunder”
  - Ergo – “We just heard thunder; did someone get hit by lightning”?
- Association!

# A little history : Associationism

- Collection of ideas stating a basic philosophy:
  - “Pairs of thoughts become associated based on the organism’s past experience”
  - **Learning** is a mental process that forms associations between temporally related phenomena
- 360 BC: Aristotle
  - "Hence, too, it is that we hunt through the mental train, excogitating from the present or some other, and from similar or contrary or coadjacent. Through this process reminiscence takes place. For the movements are, in these cases, sometimes at the same time, sometimes parts of the same whole, so that the subsequent movement is already more than half accomplished."
    - In English: *we memorize and rationalize through association*

# Aristotle and Associationism

- Aristotle's four laws of association:
  - *The law of contiguity.* Things or events that occur close together in space or time get linked together
  - *The law of frequency.* The more often two things or events are linked, the more powerful that association.
  - *The law of similarity.* If two things are similar, the thought of one will trigger the thought of the other
  - *The law of contrast.* Seeing or recalling something may trigger the recollection of something opposite.

# A little history : **Associationism**

- More recent associationists (upto 1800s): John Locke, David Hume, David Hartley, James Mill, John Stuart Mill, **Alexander Bain**, Ivan Pavlov
  - Associationist theory of mental processes: *there is only one mental process: the ability to associate ideas*
  - Associationist theory of learning: *cause and effect, contiguity, resemblance*
  - Behaviorism (early 20<sup>th</sup> century) : *Behavior is learned from repeated associations of actions with feedback*
  - Etc.

- **But where are the associations stored??**
- **And how?**

# But how do we *store* them?

## Dawn of Connectionism

David Hartley's *Observations on man* (1749)

- We receive input through vibrations and those are transferred to the brain
- Memories could also be small vibrations (called vibratiuncles) in the same regions
- Our brain represents compound or connected ideas by connecting our memories with our current senses
- Current science did not know about neurons

# Observation: *The Brain*

- Mid 1800s: The brain is a mass of interconnected neurons

# Brain: Interconnected Neurons

- Many neurons connect *in* to each neuron
- Each neuron connects *out* to many neurons

# Enter *Connectionism*

- Alexander Bain, philosopher, psychologist, mathematician, logician, linguist, professor
- 1873: The information is in the *connections*
  - *Mind and body* (1873)

# Bain's Idea 1: Neural Groupings

- Neurons excite and stimulate each other
- Different combinations of inputs can result in different outputs

# Bain's Idea 1: Neural Groupings

- Different intensities of activation of A lead to the differences in when X and Y are activated
- Even proposed a learning mechanism..

## Bain's Idea 2: Making Memories

- “when two impressions concur, or closely succeed one another, the nerve-currents find some bridge or place of continuity, better or worse, according to the abundance of nerve-matter available for the transition.”
- Predicts “Hebbian” learning (three quarters of a century before Hebb!)

# Bain's Doubts

- *“The fundamental cause of the trouble is that in the modern world the stupid are cocksure while the intelligent are full of doubt.”*
  - Bertrand Russell
- In 1873, Bain postulated that there must be one million neurons and 5 billion connections relating to 200,000 “acquisitions”
- In 1883, Bain was concerned that he hadn’t taken into account the number of “partially formed associations” and the number of neurons responsible for recall/learning
- By the end of his life (1903), recanted all his ideas!
  - Too complex; the brain would need too many neurons and connections

# Connectionism lives on..

- The human brain is a connectionist machine
  - Bain, A. (1873). *Mind and body. The theories of their relation*. London: Henry King.
  - Ferrier, D. (1876). *The Functions of the Brain*. London: Smith, Elder and Co
- Neurons connect to other neurons.  
The processing/capacity of the brain is a function of these connections
- Connectionist machines emulate this structure

# Connectionist Machines

- Network of processing elements
- **All world knowledge is stored in the *connections* between the elements**

# Connectionist Machines

- Neural networks are *connectionist* machines
  - As opposed to Von Neumann Machines

- The machine has many non-linear processing units
  - The program is the connections between these units
    - Connections may also define memory

# Recap

- Neural network based AI has taken over most AI tasks
- Neural networks originally began as computational models of the brain
  - Or more generally, models of cognition
- The earliest model of cognition was *associationism*
- The more recent model of the brain is *connectionist*
  - Neurons connect to neurons
  - The workings of the brain are encoded in these connections
- Current neural network models are *connectionist machines*

# Poll 1 (on piazza)

# Connectionist Machines

- Network of processing elements
- All world knowledge is stored in the *connections* between the elements
- *Multiple* connectionist paradigms proposed..

# Turing's Connectionist Machines

- Basic model: A-type machines
  - Random networks of NAND gates, with no learning mechanism
    - “Unorganized machines”
- Connectionist model: B-type machines (1948)
  - Connection between two units has a “modifier”
    - Whose behaviour can be learned
  - If the green line is on, the signal sails through
  - If the red is on, the output is fixed to 1
  - “Learning” – figuring out how to manipulate the coloured wires
    - Done by an A-type machine

# Connectionist paradigms: PDP

## Parallel Distributed Processing

- Requirements for a PDP system  
(Rumelhart, Hinton, McClelland, '86; quoted from Medler, '98)
  - A set of processing units
  - A state of activation
  - An output function for each unit
  - A pattern of connectivity among units
  - A propagation rule for propagating patterns of activities through the network of connectivities
  - An activation rule for combining the inputs impinging on a unit with the current state of that unit to produce a new level of activation for the unit
  - A learning rule whereby patterns of connectivity are modified by experience
  - An environment within which the system must operate

# Connectionist Systems

- Requirements for a connectionist system (Bechtel and Abrahamson, 91)
  - The connectivity of units
  - The activation function of units
  - The nature of the learning procedure that modifies the connections between units, and
  - How the network is interpreted semantically

# Connectionist Machines

- Network of processing elements
  - All world knowledge is stored in the *connections* between the elements
- *But what are the individual elements?*

# Modelling the brain

- What are the units?
- A neuron:

- Signals come in through the dendrites into the Soma
- A signal goes out via the axon to other neurons
  - Only one axon per neuron
- Factoid that may only interest me: Neurons do not undergo cell division
  - Neurogenesis occurs from neuronal stem cells, and is minimal after birth

# McCulloch and Pitts

- The Doctor and the Hobo..
  - Warren McCulloch: Neurophysiologist
  - Walter Pitts: Homeless wannabe logician who arrived at his door

# The McCulloch and Pitts model

- A mathematical model of a neuron
  - McCulloch, W.S. & Pitts, W.H. (1943). A Logical Calculus of the Ideas Immanent in Nervous Activity, Bulletin of Mathematical Biophysics, 5:115-137, 1943
    - Pitts was only 20 years old at this time

# Synaptic Model

- **Excitatory synapse:** Transmits weighted input to the neuron
- **Inhibitory synapse:** Any signal from an inhibitory synapse prevents neuron from firing
  - The activity of any inhibitory synapse absolutely prevents excitation of the neuron at that time.
    - Regardless of other inputs

Simple "networks"  
of neurons can perform  
Boolean operations

# Boolean Gates

$N_2(t) \leftrightarrow N_1(t-1)$   
net for temporal predecessor

$N_3(t) \leftrightarrow N_1(t-1) \vee N_2(t-1)$   
net for disjunction

$N_3(t) \leftrightarrow N_1(t-1) \& N_2(t-1)$   
net for conjunction

$N_3(t) \leftrightarrow N_1(t-1) \& \sim N_2(t-1)$   
net for conjunction and negation

*Figure 1.* Diagrams of McCulloch and Pitts nets. In order to send an output pulse, each neuron must receive two excitory inputs and no inhibitory inputs. Lines ending in a dot represent excitatory connections; lines ending in a hoop represent inhibitory connections.

# Complex Percepts & Inhibition in action

They can even create illusions of "perception"

*Figure 2.* Net explaining the heat illusion. Neuron 3 (heat sensation) fires if and only if it receives two inputs, represented by the lines terminating on its body. This happens when either neuron 1 (heat reception) fires or neuron 2 (cold reception) fires once and then immediately stops firing. When neuron 2 fires twice in a row, the intermediate (unnumbered) neurons excite neuron 4 rather than neuron 3, generating a sensation of cold.

# McCulloch and Pitts Model

- Could compute arbitrary Boolean propositions
  - Since any Boolean function can be emulated, any Boolean function can be composed
- Models for *memory*
  - Networks with loops can “remember”
    - We’ll see more of this later
  - Lawrence Kubie (1930): Closed loops in the central nervous system explain memory

# Criticisms

- They claimed that their nets
  - Should be able to compute a small class of functions
  - Also, if tape is provided their nets can compute a richer class of functions.
    - Additionally they will be equivalent to Turing machines
    - Dubious claim that they're Turing complete
  - They didn't prove any results themselves
- Didn't provide a learning mechanism..

# Donald Hebb

- “Organization of behavior”, 1949
- A learning mechanism:
  - “When an axon of cell *A* is near enough to excite a cell *B* and repeatedly or persistently takes part in firing it, some growth process or metabolic change takes place in one or both cells such that *A*'s efficiency, as one of the cells firing *B*, is increased.”
    - As *A* repeatedly excites *B*, its *ability* to excite *B* improves
  - *Neurons that fire together wire together*

# Hebbian Learning

- If neuron  $x$  repeatedly triggers neuron  $y$ , the synaptic knob connecting  $x$  to  $y$  gets larger
- In a mathematical model:

$$w_{xy} = w_{xy} + \eta xy$$

- Weight of the connection from input neuron  $x$  to output neuron  $y$
- This simple formula is actually the basis of many learning algorithms in ML

# Hebbian Learning

- **Fundamentally unstable**
  - Stronger connections will enforce themselves
  - No notion of “competition”
  - No *reduction* in weights
  - Learning is unbounded
- Number of later modifications, allowing for weight normalization, forgetting etc.
  - E.g. Generalized Hebbian learning, aka Sanger’s rule

$$w_{ij} = w_{ij} + \eta y_j \left( x_i - \sum_{k=1}^j w_{ik} y_k \right)$$

- The contribution of an input is incrementally *distributed* over multiple outputs..

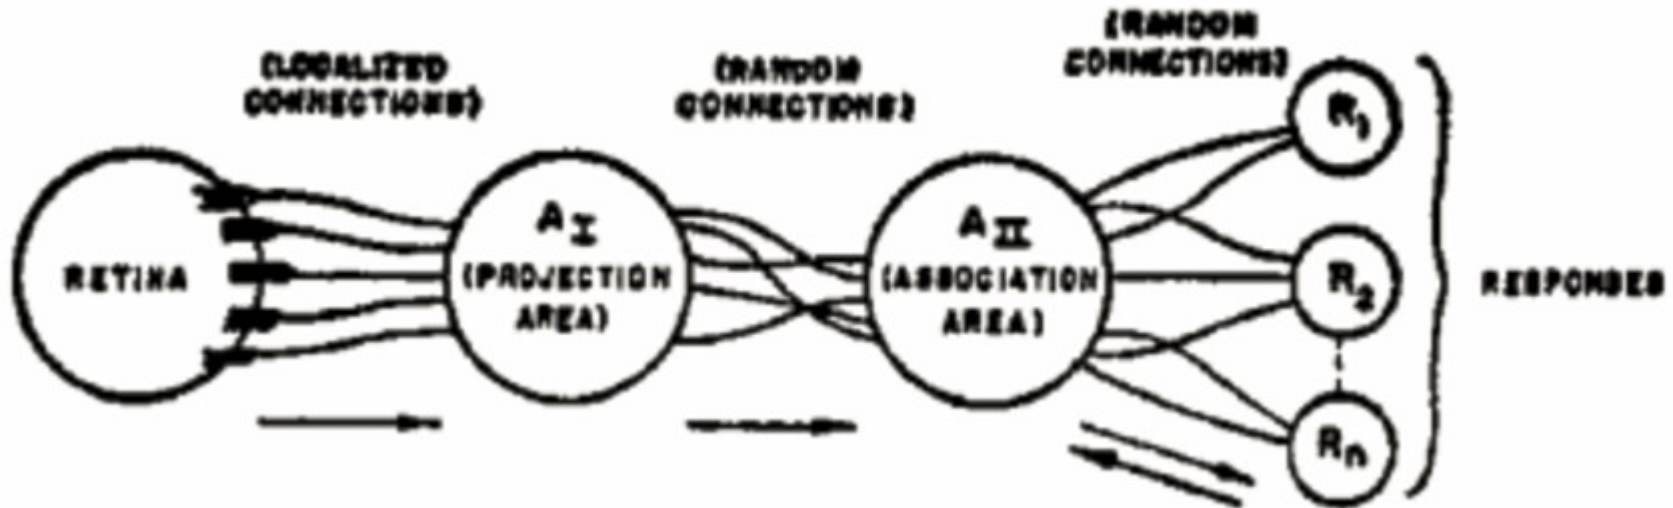

# Poll 2

# A better model

- Frank Rosenblatt
  - Psychologist, Logician
  - Inventor of the solution to everything, aka the Perceptron (1958)

# Rosenblatt's perceptron

- Original perceptron model
  - Groups of sensors (S) on retina combine onto cells in association area A<sub>I</sub>
  - Groups of A<sub>I</sub> cells combine into Association cells A<sub>II</sub>
  - Signals from A<sub>II</sub> cells combine into response cells R
  - All connections may be excitatory or inhibitory

# Rosenblatt's perceptron

- Even included feedback between A and R cells
  - Ensures mutually exclusive outputs

# Perceptron: Simplified model

- Number of inputs combine linearly
  - Threshold logic: Fire if combined input exceeds threshold

$$Y = \begin{cases} 1 & \text{if } \sum_i w_i x_i - T \geq 0 \\ 0 & \text{else} \end{cases}$$

# The Universal Model

- Originally assumed could represent *any* Boolean circuit and perform any logic
  - “the embryo of an electronic computer that [the Navy] expects will be able to walk, talk, see, write, reproduce itself and be conscious of its existence,” New York Times (8 July) 1958
  - “Frankenstein Monster Designed by Navy That Thinks,” Tulsa, Oklahoma Times 1958

# Also provided a learning algorithm

$$\mathbf{w} = \mathbf{w} + \eta(d(\mathbf{x}) - y(\mathbf{x}))\mathbf{x}$$

Sequential Learning:

$d(x)$  is the desired output in response to input  $\mathbf{x}$

$y(x)$  is the actual output in response to  $\mathbf{x}$

- Boolean tasks
- Update the weights whenever the perceptron output is wrong
  - Update the weight by the product of the input and the *error* between the desired and actual outputs
- Proved convergence for linearly separable classes

# Perceptron

Values shown on edges are weights, numbers in the circles are thresholds

- Easily shown to mimic any Boolean gate
- But...

# Perceptron

No solution for XOR!  
Not universal!

- Minsky and Papert, 1968

# A single neuron is not enough

- Individual elements are weak computational elements
  - Marvin Minsky and Seymour Papert, 1969, *Perceptrons: An Introduction to Computational Geometry*
- *Networked* elements are required

# Multi-layer Perceptron!

- **XOR**

- The first layer is a “hidden” layer
- Also originally suggested by Minsky and Papert 1968

# A more generic model

$$((A \& \bar{X} \& Z) | (A \& \bar{Y})) \& ((X \& Y) | \overline{(X \& Z)})$$

- A “multi-layer” perceptron
- Can compose arbitrarily complicated Boolean functions!
  - In cognitive terms: Can compute arbitrary Boolean functions over sensory input
  - More on this in the next class

# Story so far

- Neural networks began as computational models of the brain
- Neural network models are *connectionist machines*
  - The comprise networks of neural units
- McCullough and Pitt model: Neurons as Boolean threshold units
  - Models the brain as performing propositional logic
  - But no learning rule
- Hebb's learning rule: Neurons that fire together wire together
  - Unstable
- Rosenblatt's perceptron : A variant of the McCulloch and Pitt neuron with a provably convergent learning rule
  - But individual perceptrons are limited in their capacity (Minsky and Papert)
- Multi-layer perceptrons can model arbitrarily complex Boolean functions

# But our brain is not Boolean

- We have real inputs
- We make non-Boolean inferences/predictions

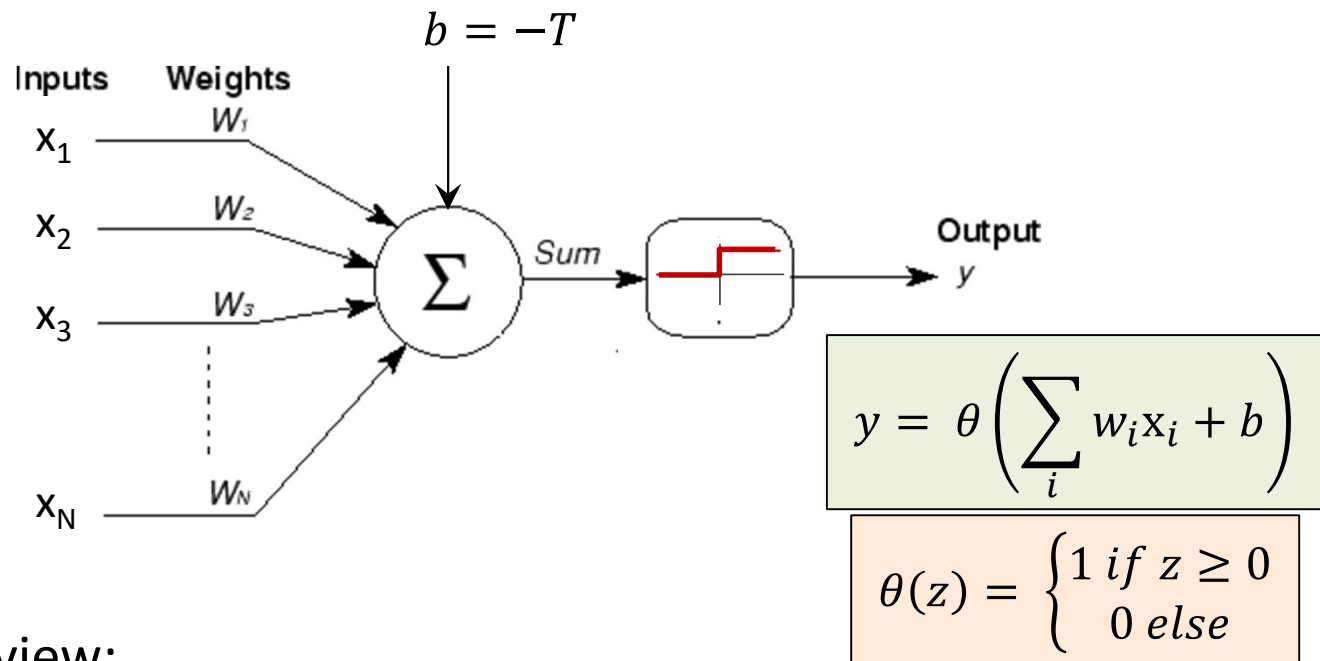

# The perceptron with *real* inputs

- $x_1 \dots x_N$  are real valued
- $w_1 \dots w_N$  are real valued
- Unit “fires” if weighted input matches (or exceeds) a threshold

$$y = \begin{cases} 1 & \text{if } \sum_i w_i x_i - T \geq 0 \\ 0 & \text{else} \end{cases}$$

# The perceptron with *real* inputs

- Alternate view:
  - A threshold “activation”  $\theta(z)$  operates on the weighted sum of inputs plus a bias
    - An *affine* function of the inputs
  - $\theta(z)$  outputs a 1 if  $z$  is non-negative, 0 otherwise
- Unit “fires” if weighted input matches or exceeds a threshold

# The perceptron with *real* inputs and a *real output*

- $x_1 \dots x_N$  are real valued
- $w_1 \dots w_N$  are real valued
- The output  $y$  can also be real valued
  - Sometimes viewed as the “probability” of firing

# The “real” valued perceptron

- Any real-valued “activation” function may operate on the affine function of the input
  - We will see several later
  - Output will be real valued
- The perceptron maps real-valued inputs to real-valued outputs
- *Is useful to continue assuming Boolean outputs though, for interpretation*

# A Perceptron on Reals

$$y = \begin{cases} 1 & \text{if } \sum_i w_i x_i \geq T \\ 0 & \text{else} \end{cases}$$

- A perceptron operates on *real*-valued vectors

– This is a *linear classifier*

# Boolean functions with a real perceptron

- Boolean perceptrons are also linear classifiers
  - Purple regions have output 1 in the figures
  - What are these functions
  - Why can we not compose an XOR?

# Composing complicated “decision” boundaries

Can now be composed into “networks” to compute arbitrary classification “boundaries”

- Build a network of units with a single output that fires if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# Booleans over the reals

- The network must fire if the input is in the coloured area

# More complex decision boundaries

- Network to fire if the input is in the yellow area
  - “OR” two polygons
  - A third layer is required

# Complex decision boundaries

- Can compose very complex decision boundaries
  - How complex exactly? More on this in the next class

# Complex decision boundaries

- Classification problems: finding decision boundaries in high-dimensional space
  - Can be performed by an MLP
- MLPs can *classify* real-valued inputs

# Story so far

- **MLPs are connectionist computational models**
  - Individual perceptrons are computational equivalent of neurons
  - The MLP is a layered composition of many perceptrons
- **MLPs can model Boolean functions**
  - Individual perceptrons can act as Boolean gates
  - Networks of perceptrons are Boolean functions
- **MLPs are Boolean *machines***
  - They represent Boolean functions over linear boundaries
  - They can represent arbitrary decision boundaries
  - They can be used to *classify* data

# Poll 3

# But what about continuous valued *outputs*?

- Inputs may be real-valued
- Can outputs be continuous-valued too?

# MLP as a continuous-valued regression

- A simple 3-unit MLP with a “summing” output unit can generate a “square pulse” over an input
  - Output is 1 only if the input lies between  $T_1$  and  $T_2$
  - $T_1$  and  $T_2$  can be arbitrarily specified

# MLP as a continuous-valued regression

- A simple 3-unit MLP can generate a “square pulse” over an input
- **An MLP with many units can model an arbitrary function over an input**
  - To arbitrary precision
    - Simply make the individual pulses narrower
- This generalizes to functions of any number of inputs (next class)

# Poll 4

# Story so far

- **Multi-layer perceptrons are connectionist computational models**
- **MLPs are *classification engines***
  - They can identify classes in the data
  - Individual perceptrons are feature detectors
  - The network will fire if the combination of the detected basic features matches an “acceptable” pattern for a desired class of signal
- **MLP can also model continuous valued functions**

# Other things MLPs can do

- Model memory
  - Loopy networks can “remember” patterns
    - Proposed by Lawrence Kubie in 1930, as a model for memory in the CNS
- Represent probability distributions
  - Over integer, real and complex-valued domains
  - MLPs can model both *a posteriori* and *a priori* distributions of data
    - A posteriori conditioned on other variables
  - MLPs can *generate* data from complicated, or even unknown distributions
- They can rub their stomachs and pat their heads at the same time..

# NNets in AI

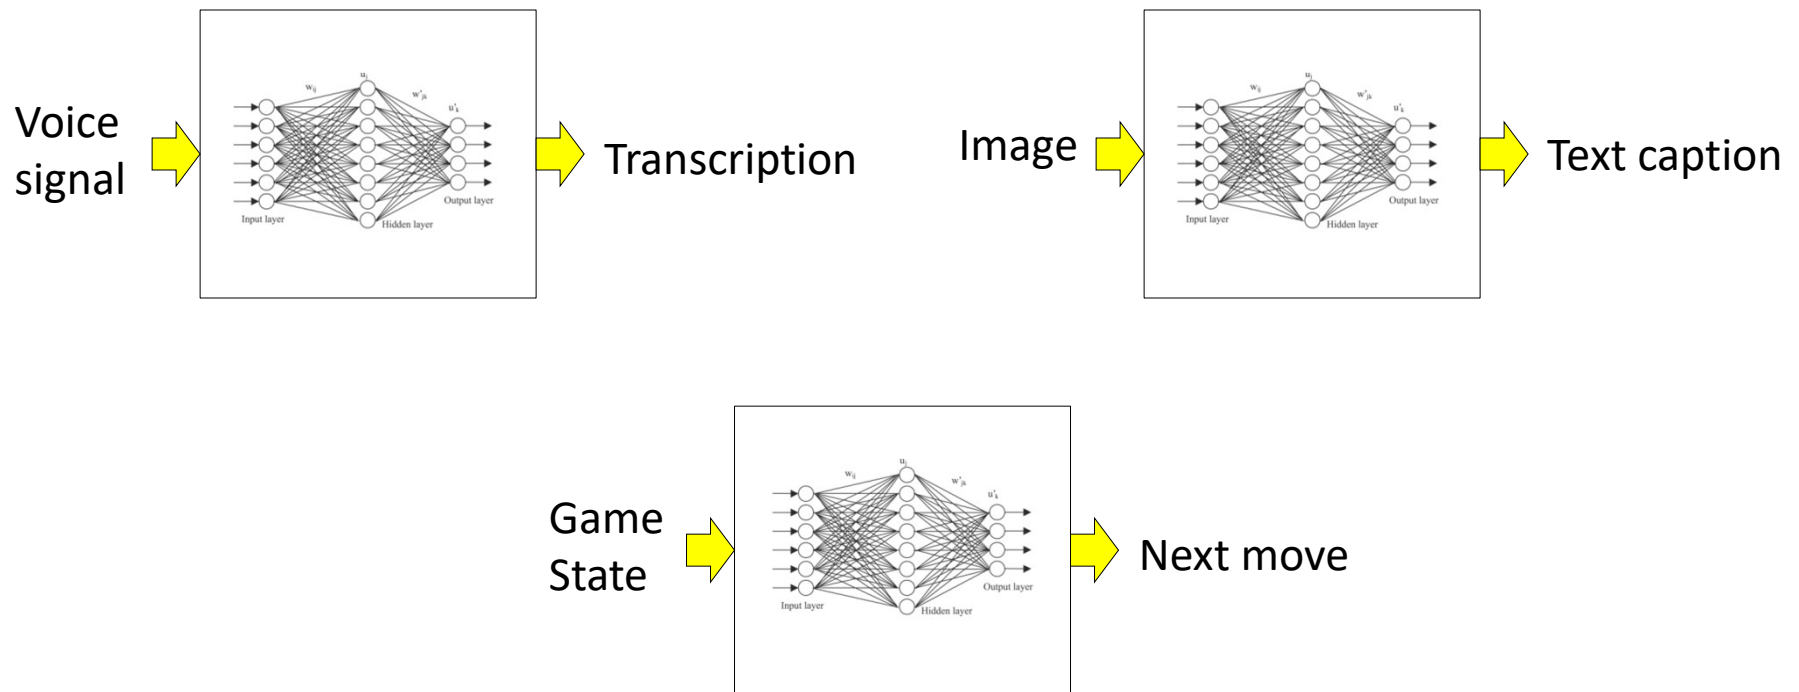

- The network is a function
  - Given an input, it computes the function layer wise to predict an output
    - More generally, given one or more inputs, predicts one or more outputs

# These tasks are *functions*

- Each of these boxes is actually a function
  - E.g  $f: \text{Image} \rightarrow \text{Caption}$

# These tasks are *functions*

- Each box is actually a function
  - E.g  $f: \text{Image} \rightarrow \text{Caption}$
  - It can be approximated by a neural network

# Story so far

- Multi-layer perceptrons are connectionist computational models
- MLPs are *classification engines*
- MLP can also model continuous valued functions
- Interesting AI tasks are functions that can be modelled by the network

# Next Up

- More on neural networks as universal approximators
  - And the issue of depth in networks
